

"Study of the maxillary transverse direction: the principles enunciated by Jean Delaire confirmed by the Cone beam".

Nicolas BEDHET, Marc BEHAGHEL, Karim ELAMRANI, Laurent ORY

Institution

- Maxillofacial Department. CHP Saint Grégoire FRANCE

Jean Delaire is our master by his knowledge and by the energy he had to transmit it to us. In particular, he has always insisted in his facial analyses and works on the distinction between the 3 compartments that make up the jaws which are the teeth and their axes, the alveolar compartment and the basal skeletal compartment to be well distinguished in a diagnosis of a global facial dysmorphism.

Concerning the study of the maxillary (and mandibular) transverse direction, and although having limited radiological tools, he described precisely these 3 components, which we have been able to study and confirm and specify with the contribution of the scanner and then the Cone Beam .
